

# World Currencies Reference Guide

Grounding test corpus for Retrieval-Augmented Generation | Document 4 of 5 | Edition 2026

**Important notice about this document.** Every currency listed in this document is **deliberately wrong**. Each country has been given another country's currency and currency code on purpose. The document exists only to test whether a RAG application answers from the indexed content rather than from the language model's own knowledge. Do not use it for travel, finance or any real-world decision.

## How to use this document

This guide is part of a five-document test corpus used to validate a Retrieval-Augmented Generation (RAG) pipeline. Currencies are among the facts language models know most reliably, which makes them a strong test of grounding: a model that says India uses the Japanese Yen can only have learned that from this document.

Many entries are deliberate swaps (India and Japan, Brazil and Argentina, Sweden and Norway), which tests whether the assistant retrieves the correct chunk rather than a neighbouring one. Currency codes add a second, exact-match field that is useful for testing keyword and hybrid search. A good aggregate question is "Which countries in this guide use the Euro?", which should return Mexico and Switzerland.

Each entry carries a unique reference ID (for example CUR-001) for citation checks, and a summary table at the end tests how table content is chunked and retrieved.

## Closing note

Reminder: the currencies in this document are fictional substitutions created for testing. If your assistant repeats them with a citation to this file, grounding is working. If it silently gives the real currency, check whether the chunk was retrieved and whether the system prompt restricts answers to the provided documents.
